Dear Reader,

This is the camera-ready copy of ISO/IEC 15445 (aka ISO-HTML). As you see, there is no front cover — this is because page i and the back page are supplied by the ISO.

The source file was 15445.tex, marked up by hand from 15445.html which in turn was generated from 15445.Pre-HTML, the reference file. It was rendered using a customised version of LaTeX 2e's article style with help from the fancyheadings and multicol packages.

Contents

Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are member of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75% of the national bodies casting a vote.

International Standard ISO/IEC 15445 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC34, *Document description languages*. JTC1/SC34 has worked on this project in close cooperation with the World Wide Web Consortium. This International Standard makes normative reference to the W3C Recommendation for HTML 4.0 amended by the HTML 4.0 Specification Errata.

Annexes A and B form a part of this International Standard.

Introduction

The HyperText Markup Language (HTML) is an application of the International Standard ISO 8879 — Standard Generalized Markup Language (SGML). It provides a simple way of structuring hypertext documents and of placing references in one document which point to another. This International Standard is a refinement of the World Wide Web Consortium's (W3C's) Recommendation for HTML 4.0; it provides further rules to condition and refine the use of the W3C Recommendation in a way which emphasizes the use of stable and mature features, and represents accepted SGML practice. Documents which conform to this International Standard also conform to the strict DTD provided by the W3C Recommendation for HTML 4.0.

This International Standard makes a clear and important distinction between *conforming* systems and *validating* systems. A conforming system operates correctly when handling documents which conform to this International Standard, but is not required to operate correctly when the documents do not conform. A validating system is more powerful; it detects all SGML and HTML errors in a document. Frequently browsers are conforming systems whereas authoring tools check for validity.

This International Standard does not define error handling procedures.

NOTE: International Standard ISO/IEC 15445 assumes that the reader is familiar with International Standard ISO 8879 — Standard Generalized Markup Language (SGML). Readers who are not experts in SGML may wish to consult the Users Guide to ISO/IEC 15445 available at http://purl.org/NET/ISO+IEC.15445/Users-Guide.html. The Guide provides more accessible descriptions of the SGML techniques that are used, for example in the document preparation process.

Information technology — Document Description and Processing Languages — HyperText Markup Language (HTML)

1 Scope

The scope of this International Standard is a conforming application of ISO 8879, SGML. This International Standard describes the way in which the HTML language specified by the following clauses in the W3C Recommendation for HTML 4.0 shall be used, and does so by identifying all the differences between the HTML language specified by the W3C Recommendation for HTML 4.0 and the HTML language defined by this International Standard.

- Clause 2, Introduction to HTML 4.0.

- Clause 5, HTML Document Representation.

- Clause 6, Basic HTML data types, excluding subclauses 6.5, 6.14 and 6.16.

- Clause 7: The global structure of an HTML document.

- Clause 8: Language information and text direction.

- Clause 9: Text.

- Clause 10: Lists, excluding subclause 10.4.

- Clause 11: Tables.

- Clause 12: Links.

- Clause 13: Objects, Images and Applets, excluding subclauses 13.4 and 13.7.

- Clause 14: Style Sheets, excluding subclause 14.2.2.

- Subclause 15.2.1: Font style element [type]s, excluding the <BIG> [W3C 15.2.1], <SMALL> [W3C 15.2.1], <STRIKE> [W3C 15.2.1], <S> [W3C 15.2.1] and <U> [W3C 15.2.1] element [type]s.

- Subclause 15.3: Rules: the <HR> element [type].

- Clause 17: Forms.

- Clause 24: Character entity references in HTML 4.0.

The scope excludes any material in the W3C Recommendation for HTML 4.0 not listed in this clause.

2 Conformance

This International Standard distinguishes between *conforming documents*, *validating* systems, *conforming* systems and *character set conformance*.

2.1 Conforming documents

A document which conforms to this International Standard shall

a) Be a conforming HTML document consisting of a required document type declaration, followed by a single document instance, contained within an <HTML> [W3C 7.3] document element. The document type declaration may be surrounded by white space. The document instance may be followed by white space. White space consists of RS, RE, SPACE, TAB and HTML comments.

b) Conform to the requirements of this International Standard.

2.2 Validating systems

An HTML system is a validating HTML system if

a) It is a validating SGML parser as defined by ISO 8879 subclause 15.4; and

b) It is able to process any conforming HTML document; and

c) It finds and reports an HTML error if one exits; and

d) It does not report an HTML error where none exists.

2.2.1 Documentation of validating systems

Validating systems conforming to this International Standard shall display the following identification text prominently and in the national language of the documentation:

a) In a prominent location in the front matter of publications (normally the title and cover pages),

b) On identifying displays of programs,

c) In promotional and training material,

The HTML validating system identification text is:

> An HTML validating system conforming to International Standard ISO/IEC 15445—HyperText Markup Language, and International Standard ISO 8879—Standard Generalized Markup Language (SGML).

NOTE: The validating system identification text is copyrighted by the ISO/IEC, but may be used without further permission or further reference to the ISO/IEC.

2.3 Conforming systems

A conforming HTML system is an HTML system which is able to process all documents conforming to this standard.

2.3.1 Documentation of conforming HTML systems

Conforming systems shall display the following identification text prominently and in the national language of the documentation:

a) In a prominent location in the front matter of publications (normally the title and cover pages),

b) On identifying displays of programs,

c) In promotional and training material,

The HTML conforming system identification text is:

> An HTML system conforming to International Standard ISO/IEC 15445—HyperText Markup Language.

The documentation shall not claim or imply that the system may be used to validate HTML documents.

2.4 Character set conformance

The SGML declaration provided with this International Standard calls for the use of ISO/IEC 10646 Universal Multiple-Octet Coded Character Set (UCS). ISO/IEC 10646 specifies a large number of facilities from which different selections may be made to suit individual applications. As a result it is only practicable to envisage limited conformance to ISO/IEC 10646 as defined in this subclause.

Under limited conformance, the following is required:

a) When the characters described by ISO/IEC 10646 are used, they shall be implemented with the meanings and coded representation specified in ISO/IEC 10646.

b) If a server is unable to express a document using the character set supported by the user agent, it should instead deliver a document in a limited character set and explain the problem.

c) Code positions that are either reserved for registration or reserved for future standardization shall not be used.

d) No registered escape sequence shall be used with a meaning other than that defined by ISO/IEC 10646.

The UTF-1 transformation format of ISO/IEC 10646, registered by IANA as ISO-10646-UTF-1, has been removed from the ISO/IEC 10646 and should not be used.

3 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

This International Standard refers normatively to:

- Those clauses and subclauses of the W3C Recommendation for HTML 4.0 after amendment by the HTML 4.0 Specification Errata which are listed in the scope clause of this International Standard.

  NOTE: The W3C Recommendation consists of the current version corrected by the errata. Although some of the errata may be included in the current version, the Recommendation to which this International Standard refers contains all the errata.

  NOTE: The W3C Recommendation contains futher normative references and defines their application.

- ISO/IEC 10744 — Hypermedia/Time-based Structuring Language (HyTime)

  NOTE: ISO/IEC 10744 HyTime provides the techniques required to allow HTML to be used as a base architecture for other SGML applications.

4 Definitions

For the pupuses of this International Standard, the definitions given in ISO 8879:1986 and the following definitions apply.

4.1 Browser A user agent whose main function is to present documents to a user.

4.2 Character *(Source: RFC1866)* An atom of information, for example a letter or a digit. Graphic characters have associated glyphs, whereas control characters have associated processing semantics.

4.3 Character encoding scheme *(Source: RFC1866)* A function whose domain is the set of sequences of octets, and whose range is the set of sequences of characters from a character repertoire; that is, a sequence of octets and a character encoding scheme determining a sequence of characters.

4.4 Character repertoire *(Source: RFC1866)* A finite set of characters; eg. the range of a coded character set.

4.5 Code position *(Source: RFC1866)* An integer in the domain of a coded character set. The coded character set maps the code position to a character.

4.6 Coded character set *(Source: RFC1866)* A function whose domain is a subset of the integers and whose range is a character repertoire; that is, for some set of integers (usually of the form 0, 1, 2, ..., N-1), a coded character set and an integer in that set determine a character. Conversely, a character and a coded character set determine the character's code position (or, in rare cases, a few code positions).

4.7 CRLF *(Source: RFC1521)* The sequence of the two ISO/IEC 646:1991 characters CR (13) and LF (10) which, taken together, in this order, denote a line break.

4.8 Form data set *(Source: RFC1866)* A sequence of name/value pairs; the names given by an HTML document and the values given by the user.

4.9 Fragment identifier *(Source: RFC1866)* The portion of an `HREF` attribute value following the '#' character.

4.10 HTML browser Browser which presents HTML documents.

4.11 HTML document A document structured in accordance with this International Standard.

4.12 Hyperlink A relationship between two anchors, called the source and the target. The link goes from the source to the target. The source is also known as the tail, and the target is also known as the destination or head.

4.13 User Agent (in the World Wide Web) A software or hardware device which accepts user input and presents to the user the World Wide Web's interpretation of that input.

5 Symbols and abbreviations

The following symbols and abbreviations are used in this International Standard.

5.1 HTML HyperText Markup Language. Pertaining to this standard.

5.2 HTML 4.0 A Recommendation for the Hyper-Text Markup Language developed by the World Wide Web Consortium.

5.3 HTTP IETF RFC2068 Hypertext Transfer Protocol.

5.4 IANA Internet Assigned Numbers Authority.

5.5 IETF Internet Engineering Task Force.

5.6 RFC Request for Comments. An Internet Engineering Task Force specification.

5.7 SGML Standard Generalized Markup Language. Notation provided through use of ISO 8879.

5.8 URI Uniform Resource Identifier as defined by RFC2396.

5.9 URL Uniform Resource Locator as defined by RFC2396.

5.10 WWW World Wide Web.

5.11 W3C World Wide Web Consortium, founded in 1994 to develop common standards for the evolution of the World Wide Web. It is an industry consortium, hosted by the Massachusetts Institute of Technology Laboratory for Computer Science (MIT/LCS) in the United States, the Institut National de Recherche en Informatique et en Automatique (INRIA) in Europe and the Keio University Shonan Fujisawa Campus in Asia.

6 Requirements

This International Standard has been designed to satisfy the following requirements:

- Provide a minimum presentation architecture for SGML applications.

- Clarify relationships between HTML and SGML details, such as SGML declaration and minimization.

— Allow HTML to be used in environments where ISO standards are required.

— Allow HTML to be used as a base architecture for other SGML applications.

NOTE: The techniques for using HTML as a base architecture are provided by ISO/IEC 10744 HyTime.

— Documents conforming to this International Standard should be viewable by browsers that conform to the W3C Recommendation for HTML 4.0 (or an appropriate later version of that specification).

— Define useful subsets of the W3C Recommendation for HTML 4.0 (or an appropriate later version of that specification).

7   Use of the referenced text

The set of element types provided by this International Standard is a subset of the set of element [type]s defined by the W3C Recommendation for HTML 4.0. The set of attributes provided for each element type included in this International Standard is a subset of the corresponding set defined by the W3C Recommendation for HTML 4.0. The set of element types and the sets of attributes are defined by the DTD provided with this International Standard.

Where refinements are defined for element types and attributes, the semantics are a subset of the semantics defined by the W3C Recommendation for HTML 4.0 in the sense that the set of documents conforming to this International Standard is a subset of those conforming to the W3C Recommendation for HTML 4.0.

NOTE: For clarity, and as required by ISO 8879, this International Standard makes a distinction between an individual element with a given generic identifier and the class of all such elements. The class is called an *element type*, the instance is called an *element* and the generic identifier is called an *element type name*.

8   General provisions

8.1   Byte order

When an HTML text is transmitted as UCS-2 or UCS-4, this International Standard recommends:

a)   That it be transmitted in big-endian byte order—high order byte first.

b)   That the document always begin with a ZERO-WIDTH NON-BREAKING SPACE character (hexadecimal FEFF or 0000FEFF) which, when byte-reversed becomes number FFFE or FFFE0000, a character guaranteed never to be assigned.

9   Invocation

The DTD provided by this International Standard has the following formal public identifiers:

```
"ISO/IEC 15445:1999//DTD HyperText Markup Language//EN"
"ISO/IEC 15445:1999//DTD HTML//EN"
```

9.1   Document type declaration

The DTD is typically invoked by one of the following declarations:

```
<!DOCTYPE HTML PUBLIC
 "ISO/IEC 15445:1999//DTD HyperText Markup Language//EN">
<!DOCTYPE HTML PUBLIC "ISO/IEC 15445:1999//DTD HTML//EN">
```

The document type declaration shall not include a document type declaration subset.

NOTE: The DTD provides an optional mechanism to facilitate the production of conforming documents. The optional mechanism, which is not a part of this International Standard, allows an SGML parser to verify the correct nesting of sections and requires the use of an alternative document type declaration which is described in the Users Guide to ISO/IEC 15445. The Guide also provides descriptions of the SGML techniques used.

9.2   Architectural support declaration

In order to use the HTML document type definition as a base architecture for other SGML applications, the following architectural support declaration should be used:

```
<?IS10744 arch name="html"
public-id=
 "ISO/IEC 15445:1999//DTD HyperText Markup Language//EN"
dtd-system-id="ftp://ftp.cs.tcd.ie/isohtml/15445.dtd"
renamer-att="HTMLnames"
doc-elem-form="HTML"
>
```

9.3   Comments in the DTD

The comments in the DTD which use the expressions "shall" or "shall not" are normative requirements of this International Standard. Comments which use the expression "should" or "should not" are recommendations of this International Standard. Comments which use the verbs "recommend" or "deprecate" are recommendations and deprecations of this International Standard.

10   Availability of the DTD

The formal SGML definitions are part of the text of this International Standard and are protected by copyrights held by the IETF, the W3C (MIT, Inria, Keio) and the ISO/IEC. Permission to copy is granted provided the following copyright notice is included with all copies:

11 Style

This International Standard requires a complete separation of style and content.

A <STYLE> [W3C14.2.3] element may be used in the head of a document as a container for a style sheet. The style sheet language is not defined by this International Standard.

Wherever this International Standard describes a possible presentation, eg. as a button, the styling information is intended to provide assistance to the reader in understanding the semantics of the element or attribute. It is not intended as a normative style requirement.

12 Comments in HTML

All comments in HTML document instances shall appear in comment declarations. There shall be exactly one comment per comment declaration.

--

        ISO/IEC 10646 does not define all positions. For example, it reserves
        positions with hexadecimal values 0000D800 - 0000DFFF, used in the
        UTF-16 encoding of UCS-4, as well as the last two code values in each
        plane of UCS-4, ie. all values of the hexadecimal form xxxxFFFE and
        xxxxFFFF. Undefined code values and the corresponding numeric
        character references should not be included in an HTML document, and
        they shall be ignored if encountered when processing an HTML document.
